

## WHAT?

### SWG2's Challenge

Enhance cooperation between stakeholders and facilitate common understanding of how to reduce methane emissions in the LNG industry.

## HOW?

### Approach to the Challenge

1

#### Analysing Drivers and Limiting Factors

Provide background study on challenges in 3 areas of methane emission mitigation work: quantification (accuracy), verification (standardisation), incentivisation to reduce emission intensity of cargos (fair and effective policy instruments).

2

#### Debate and exchange

Organise 3 workshops involving 47 representatives from a diverse group of stakeholders, including production, shipping, trading, governments, academia, and MRV service providers.

3

#### Recommendations

1. Developing an industry standard for quantification still requires more robust and publicly available data: targeted funding for independent organisations to provide this data and develop accepted best practice measurement processes and technology.

2. Swift standardisation of industry approaches to measurement, reporting and verification (MRV) will require regulatory intervention: Support collaboration within the industry on MRV, and intensify collaboration between governments on effective policy instruments
